Design Document (DD)

1 Introduction

This design document will specify a class diagram and some sequence diagrams which will specify some behaviors of our software. A class diagram is a structure which describes the structure of a system by showing the classes, the attributes, operations or methods and the relationship between them. A class is the description of a group of objects with common properties (attributes), common behavior and common relationships with other objects as well as common semantics. Class diagrams are used to model:

- System vocabulary, as classes are identified as relevant abstractions
- Collaborations, as these classes must be identified so the desired behavior of the software is identified
- It's also a logic database scheme

In the class diagram for this software, you will be able to identify classes and attributes and methods inside them. You will also be able to identify visibility, some comments, the class's name and the multiplicity.

In terms of visibility, there are four types:

- public: accessible for all clients.
- protected: members of a class can only be accessed by sub-classes, friend classes or the same class.
- private: members if a class can only be accessed by friend classes or the same class.
- implementation: can only be accessed by the implementation of the package that contains it.

On the other hand, sequence diagrams can also be found in this document. UML Sequence diagrams are interaction diagrams that detail how operations are carried out. Interaction between objects can be seen in the context of collaboration. They show the order of the interaction visually.

The content of this document it:

- Introduction
- Diagram
- Sequence Diagrams

Version: v1.0 Date: June 20, 2019

Pag. 4 of 8

The image below show a class diagram of MY-NEIGH software. The relationships between classes are defined with arrows. They are represented in the following way:

Type	Symbol	Drawing
Extension	<	ightharpoons
Composition	*	←
Aggregation	0	←
Association		

Figure 1: Relationships in class diagrams

```
@startuml
User < |-- Neighbour
User < | -- Property Administrator
Neighbour < |-- President
PropertyAdministrator "1" -- "1..n" NA: has >
Neighbour "n" -- "1..n" NA: has >
Warning .> WarningStatus: uses >
Calendar ... > Calendar View Type
NA "1" *-- "1" WarningManagement: contains >
WarningManagement "1" o— "n" Warning
ChatController — Chat
NA *-- ChatController: contains >
NA "1" *-- "1" CalendarManagement: contains >
Calendar Management — Calendar
Calendar "1" --> "1..n" Event: uses >
NA "1" *-- "1..n" Contacts: has >
Contacts o- Suppliers
NA "1" *-- "1" AccountNA: has >
AccountNA — Payment
Invoice "1..n" — o "1" NA
Budget "1..n" ---o "1" NA
@enduml
```

3 Sequence Diagrams

3.1 Sequence diagram: Adding an event

The sequence diagram for the addition of an event is shown here. It describes the steps when a user decides to go to the calendar, add an event and add some information about it.

3.2 Sequence diagram: Notification management

This is the sequence diagram for the management of notifications. It describes the steps from adding a warning to receiving a notification from the point of view of another neighbour.

Design Document (DD)

3.3 Sequence diagram: User management

This is the sequence diagram for user management. The APP administrator will be able to delete a user from the database.
